

Teaching Introductory Physics Through Problem Solving

“I understand the material, I just can’t solve the problems.”

$$\begin{aligned}\Sigma F &= ma \\ f_k &= \mu N \\ W &= mg\end{aligned}$$

Ken Heller
School of Physics and Astronomy
University of Minnesota

15 year continuing project to improve undergraduate education with contributions by:
Many faculty and graduate students of U of M Physics & Education
In collaboration with U of M Physics Education Group

Pat Heller, Leon Hsu, Vince Kuo – University of Minnesota
Charles Henderson – Western Michigan University
Edit Yerushalmi – Weizmann Institute
Laura McCullough – University of Wisconsin, Stout

Tom Foster – University of Southern Illinois
Jennifer Blue – Miami University, Ohio
Mark Hollabaugh – Normandale Community College
Ron Keith – Emporia State University

Research Based Curriculum and Assessment

**Details and
discussion in
the workshop**

Goals

- Why Solve Problems?
- What are Problems?
- Experts and Novices

Students

- Skills & Misconceptions

Teaching Problem Solving?

- Instructional Framework
- Supporting Problem Solving

Instructors

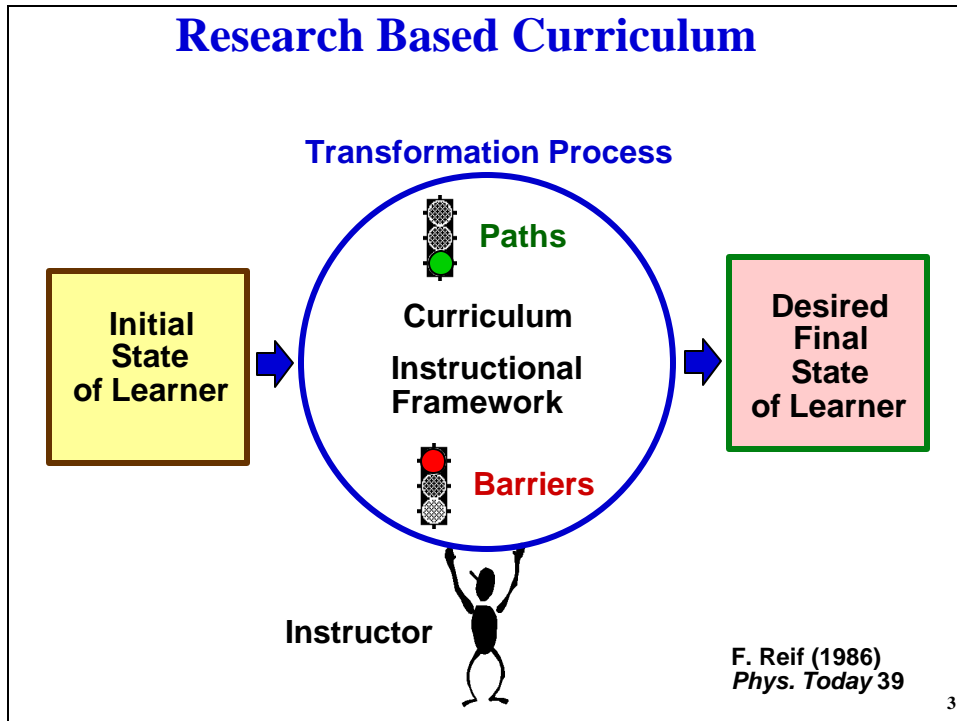

- Beliefs & Values

How Well Does It Work

- Data

2

Research Based Curriculum

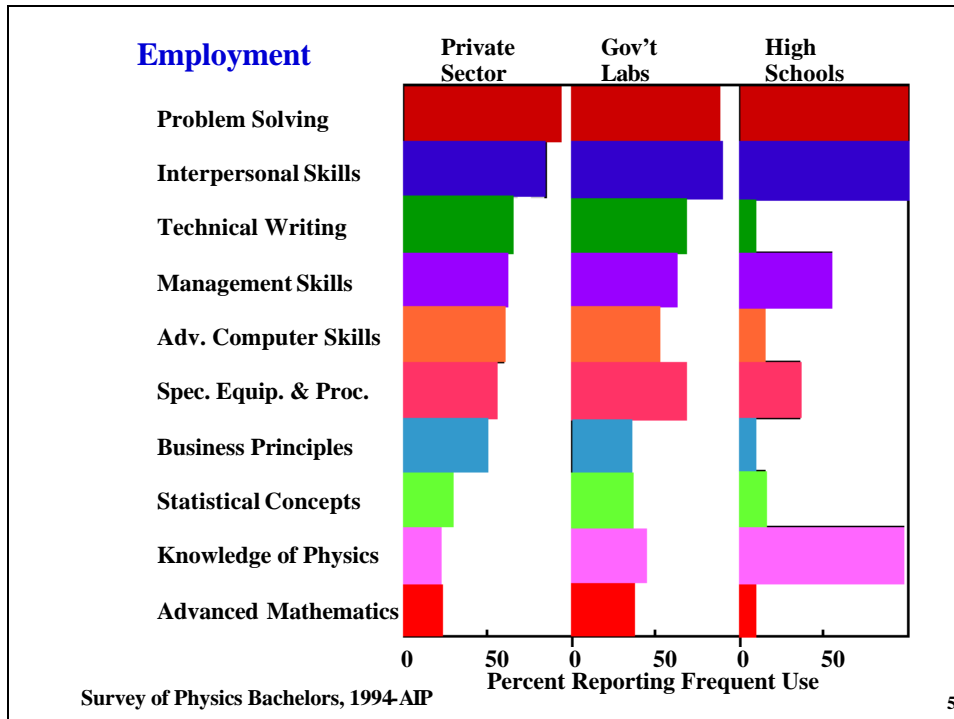

Why Teach Students to Solve Problems?

- ◆ Society Wants It
- ◆ Employers Want It
- ◆ Other Departments Want It
- ◆ Our Department Wants It

What is IT?

What Do Departments Want?

Goals: Calculus-based Course (88% engineering majors)

- 4.5 Basic principles behind all physics
- 4.5 General qualitative problem solving skills
- 4.4 General quantitative problem solving skills
- 4.2 Apply physics topics covered to new situations
- 4.2 Use with confidence

Goals: Algebra-based Course (24 different majors)

- 4.7 Basic principles behind all physics
- 4.2 General qualitative problem solving skills
- 4.2 Overcome misconceptions about physical world
- 4.0 General quantitative problem solving skills
- 4.0 Apply physics topics covered to new situations

6

What Is Problem Solving?

“Process of Moving Toward a Goal When Path is Uncertain”

- If you know **how** to do it, its **not** a problem.

Problems are solved using tools

General-Purpose Heuristics

Not algorithms

“Problem Solving Involves **Error and Uncertainty**”

A problem for your student is not a problem for you

Exercise vs Problem

M. Martinez, Phi Beta Kappa, April, 1998

7

Some Heuristics

Means - Ends Analysis

identifying goals and subgoals

Working Backwards

step by step planning from desired result

Successive Approximations

range of applicability and evaluation

External Representations

pictures, diagrams, mathematics

General Principles of Physics

8

Teaching Students to Solve Problems

Solving Problems Requires Conceptual Knowledge:

From **Situations** to **Decisions**

- Visualize situation
- Determine goal
- Choose applicable principles
- Choose relevant information
- Construct a plan
- Arrive at an answer
- Evaluate the solution

Students must be taught *explicitly*

**The difficulty -- major misconceptions,
lack of metacognitive skills, no heuristics**

9

Problem Solving Requires

Metacognitive Skills

- **Managing time and direction**
- **Determining next step**
- **Monitoring understanding**
- **Asking skeptical questions**
- **Reflecting on own learning process**

10

Initial State of the Learner

Students have Misconceptions about

The Field of Physics

Learning Physics

Nature

Problem-solving

All combine to make it difficult for students to solve problems.

Not the same as “getting a problem right”.

11

Students' Misconceptions About Problem Solving

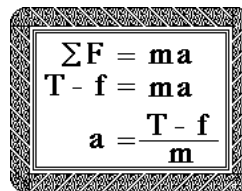

You need to know the right formula to solve a problem:

Memorize formulas

Memorize solution patterns

Bring in "crib" sheets

$$\begin{aligned}\Sigma F &= ma \\ T - f &= ma \\ a &= \frac{T - f}{m}\end{aligned}$$

It's all in the mathematics:

Manipulate the equations as quickly as possible

Plug-and-chug

Numbers are easier to deal with

Plug in numbers as soon as possible

12

Calvin and Hobbes / By Bill Watterson

13

Practice Makes Perfect BUT

Traditional "Problems"

- ◆ Can often be solved by manipulating equations
- ◆ Little visualization necessary
- ◆ Few decisions necessary
- ◆ Disconnected from student's reality
- ◆ Can often be solved without knowing physics

What is being practiced?

14

From a Textbook

Cart A, which is moving with a constant velocity of 3 m/s, has an inelastic collision with cart B, which is initially at rest as shown in Figure 8.3. After the collision, the carts move together up an inclined plane. Neglecting friction, determine the vertical height h of the carts before they reverse direction.

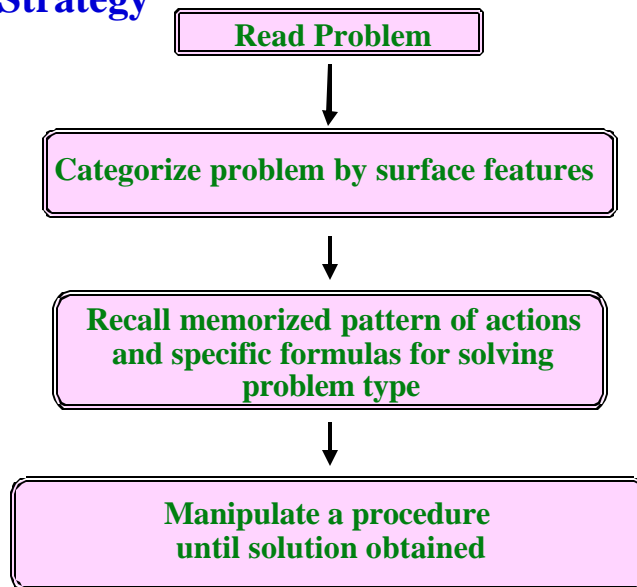

Figure 8.3

15

Novice Strategy

Cart A, which is moving with a constant velocity of 3 m/s, has an **inelastic collision** with cart B, which is initially at rest as shown in Figure 8.3. After the collision, the carts move together up an **inclined plane**. Neglecting friction, determine the **vertical height h** of the carts before they reverse direction.

16

Typical Student Test

Handwritten student work on lined paper showing physics calculations for projectile motion. The work includes a diagram of a rock being thrown from a height of 500m at an angle of 11 degrees. The student uses kinematic equations to find the time of flight and the horizontal velocity.

Diagram: A rock is thrown from a height of 500m at an angle of 11 degrees. The horizontal distance is 100m. The initial velocity is v_0 .

Equations used:

- $x = v_x t$
- $y = v_y t + \frac{1}{2} a t^2$
- $x = v_0 \cos(11^\circ) t$
- $y = v_0 \sin(11^\circ) t - \frac{1}{2} g t^2$
- $500 = v_0 \sin(11^\circ) t - \frac{1}{2} (9.8) t^2$
- $t = \frac{x}{v_0 \cos(11^\circ)}$
- $500 = v_0 \sin(11^\circ) \left(\frac{x}{v_0 \cos(11^\circ)} \right) - \frac{1}{2} (9.8) \left(\frac{x}{v_0 \cos(11^\circ)} \right)^2$
- $500 = x \tan(11^\circ) - \frac{1}{2} (9.8) \frac{x^2}{v_0^2 \cos^2(11^\circ)}$
- $500 = 100 \tan(11^\circ) - \frac{1}{2} (9.8) \frac{100^2}{v_0^2 \cos^2(11^\circ)}$
- $500 = 19.6 - \frac{4900}{v_0^2 \cos^2(11^\circ)}$
- $480.4 = -\frac{4900}{v_0^2 \cos^2(11^\circ)}$
- $v_0^2 \cos^2(11^\circ) = -\frac{4900}{480.4}$
- $v_0 \cos(11^\circ) = \sqrt{-\frac{4900}{480.4}}$
- $v_0 \cos(11^\circ) = 13.9 \text{ m/s}$

Final conclusion: he would have to roll the rock at 13.9 m/s

17

Appropriate Problems for Problem Solving

The problems must be challenging enough so there is a *real* advantage to using **problem solving heuristics**.

1. The problem must be **complex** enough so the best student in the class is not certain how to solve it.

The problem must be **simple** enough so that the solution, once arrived at, can be understood and appreciated.

18

2. The problems must be designed so that

- the major problem solving **heuristics** are **required** (e.g. physics understood, a situation requiring an external representation);
- there are several **decisions** to make in order to do the problem (e.g. several different quantities that could be calculated to answer the question; several ways to approach the problem);
- the problem **cannot be resolved in a few steps** by copying a pattern.

19

3. The task problem must connect to each student's mental processes

- the situation is **real** to the student so other information is connected;
- there is a **reasonable goal** on which to base decision making.

20

This Does Not Reinforce Problem Solving

A block starts from rest and accelerates for 3.0 seconds. It then goes 30 ft. in 5.0 seconds at a constant velocity.

- a. What was the final velocity of the block?
- b. What was the acceleration of the block?

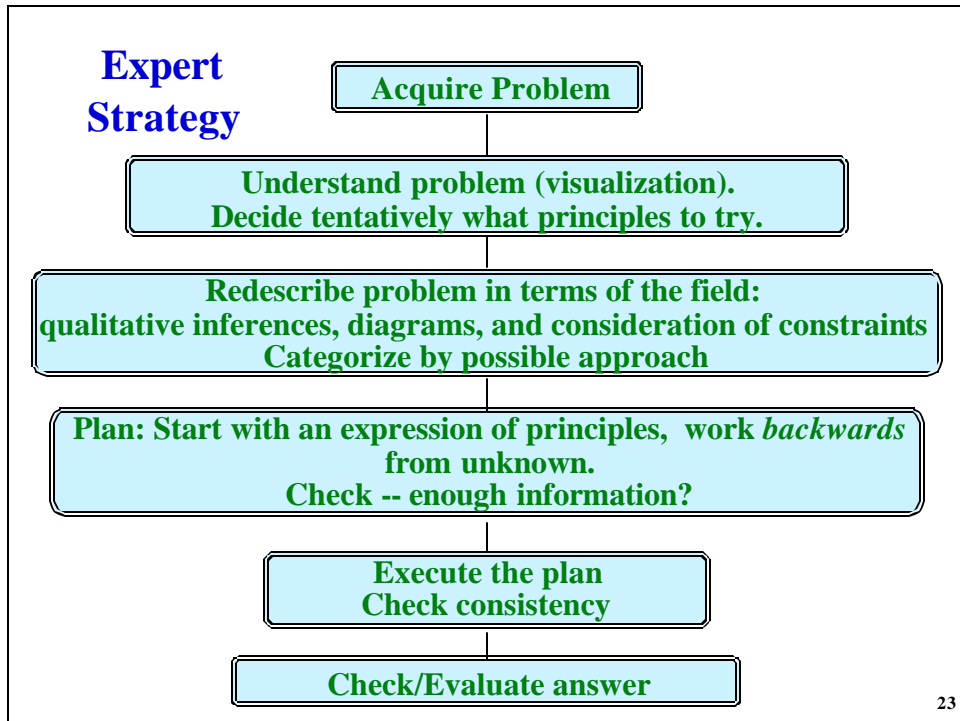

Textbook Problem

21

Context-Rich Problem

You have a summer job with an insurance company and are helping to investigate a tragic "accident." At the scene, you see a road running straight down a hill that is at 10° to the horizontal. At the bottom of the hill, the road widens into a small, level parking lot overlooking a cliff. The cliff has a vertical drop of 400 feet to the horizontal ground below where a car is wrecked 30 feet from the base of the cliff. A witness claims that the car was parked on the hill and began coasting down the road, taking about 3 seconds to get down the hill. Your boss drops a stone from the edge of the cliff and, from the sound of it hitting the ground below, determines that it takes 5.0 seconds to fall to the bottom. You are told to calculate the car's average acceleration coming down the hill based on the statement of the witness and the other facts in the case. Obviously, your boss suspects foul play.

22

Context-rich Problems

- Each problem is a short story in which the major character is the student. That is, each problem statement uses the personal pronoun "**you**."
- The problem statement includes a plausible **motivation** or reason for "you" to calculate something.
- The **objects** in the problems are **real** (or can be imagined) -- the idealization process occurs explicitly.
- **No pictures** or diagrams are given with the problems. Students must visualize the situation by using their own experiences.
- The problem can **not** be solved in **one step** by plugging numbers into a formula.

24

Because parents are concerned that children are taught incorrect science in cartoon shows, you have been hired as a technical advisor for the Cowboy Bob show. In this episode, Cowboy Bob is camped on the top of Table Rock. Table Rock has a flat horizontal top, vertical sides, and is 500 meters high. Cowboy Bob sees a band of outlaws at the base of Table Rock 100 meters from the side wall. The outlaws are waiting to rob the stagecoach. Cowboy Bob decides to roll a large boulder over the edge and onto the outlaws. Your boss asks you if it is possible to hit the outlaws with the boulder. Determine how fast Bob will have to roll the boulder to reach the outlaws.

Handwritten student work showing physics calculations for projectile motion. The work includes a diagram of a boulder being rolled off a cliff of height 500m. The student uses the equation $x = v_i t + \frac{1}{2} a t^2$ to find the time t it takes for the boulder to fall 500m. They calculate $t = 7.14$ s. Then they use $v_x = v_i$ to find the required initial velocity $v_i = 13.9$ m/s. The student concludes: "he would have to roll the rock at 13.9 m/s".

Students need instructional support to solve problems

Problem-solving Framework Used by experts in all fields

STEP 1

Recognize the Problem
What's going on?

STEP 2

Describe the problem in terms of the field
What does this have to do with ?

STEP 3

Plan a solution
How do I get out of this?

STEP 4

Execute the plan
Let's get an answer

STEP 5

Evaluate the solution
Can this be true?

The Dilemma

Start with simple problems
to learn expert-like strategy.

Success using novice strategy.

Why change?

Start with complex problems
so novice strategy fails

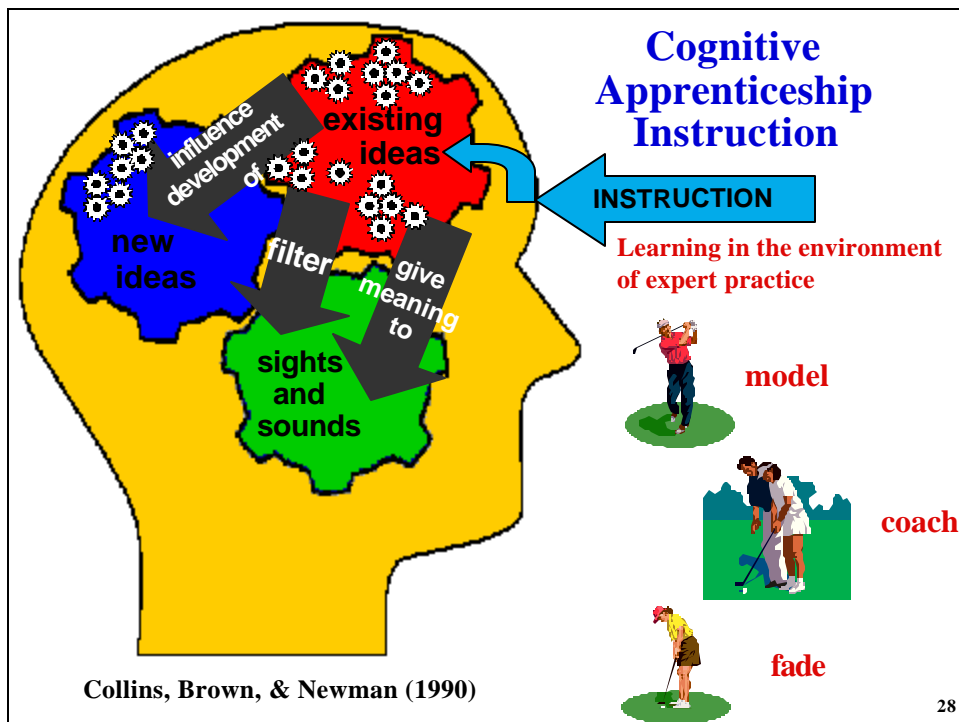

Difficulty using new strategy.

Why change?

27

Cooperative Group Problem Solving

Emphasis: Fundamental Physics Principles & Problem Solving

**Problem Design and Problem-solving Framework
based on expert-novice research**

Coaching based on collaborative learning research

Constraints: Lecture, Recitation and Laboratory

- Lectures: **MODEL** concept construction in problem context and competent problem solving
 - Recitation and Laboratory: **COACH** problem solving
- Scaffolding**
- Context-rich problems that require physics decisions
 - Explicit problem-solving framework
 - **Structured cooperative groups**
- Remove scaffolding: **FADE** support

29

Cooperative Groups

- ◆ **Positive Interdependence**
- ◆ **Face-to-Face Interaction**
- ◆ **Individual Accountability**
- ◆ **Explicit Collaborative Skills**
- ◆ **Group Functioning Assessment**

30

Why Group Problem Solving May Not Work

1. Inappropriate Tasks

2. Inappropriate Grading

Today's Workshop

3. Poor structure and management of Groups

**Curricular Elements Do Not Correspond
to the Instructor's Beliefs or Values**

31

Interview to Probe Instructor Beliefs & Values about Teaching Problem Solving in Introductory Physics

1½ - 2 hour interview based on instructional “artifacts”:

- ☑ **3 Instructor solutions:** varied in the details of their **explanation, physics approach, and presentation structure**
- ☑ **5 Student solutions:** based on student final examination solutions to represent **features of student practice**
- ☑ **4 Problem types:** represent a range of the **types of problems used** in introductory physics courses

All artifacts were based on **a single problem** that instructors were asked to solve before the interview.

Details in Charles Henderson's thesis on our web site

32

Data

- Analysis of student exams
- Observation of student interactions
- Measures of conceptual understanding
 - FCI (Force Concept Inventory)
 - Other inventories
 - Open ended questions
 - Interviews
- Measures of hierarchical structure of physics
- Measures of student satisfaction
 - Surveys
 - Dropout rate
- Ease of implementation
- Survey goals of faculty consumers
- Interviews to determine instructor instructional framework

33

Improvement in Problem Solving

Logical Progression

General Approach - does the student understand the physics

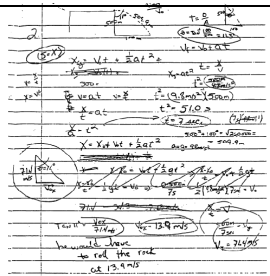

Specific Application of the Physics - starting from the physics they used, how did the student apply this knowledge?

Logical Progression - is the solution logically presented?

Appropriate Mathematics - is the math correct and useful?

34

Student Problem Solutions

Initial State

Problem 1/

Question: how far away from the tree does the fruit and arrow combination land?
 Approach: use conservation of momentum and kinematics
 assume constant acceleration due to gravity
 neglect wind resistance
 use kinematics from the time the arrow leaves the bow until just before it hits the fruit
 and just after it hits the fruit until they hit the ground
 the physics is the same and geometry for the first part and the geometry for the second part

Quantitative relationships:
 $v_{x0} = v_0 \cos \theta$ $p_x = (m_a + m_f) v_{x0}$
 $h = v_0 y \Rightarrow \frac{2h}{g} = t^2 \Rightarrow \sqrt{\frac{2h}{g}} = t$
 $p_x = p_f \Rightarrow m_a v_{x0} = (m_a + m_f) v_{x0} \Rightarrow v_{x0} = \frac{m_a}{m_a + m_f} v_0$
 $p_y = m_a v_{y0}$
 Target: d

Plan the Solution: unknown: d
 $d = v_{x0} t$
 $v_{x0} = \frac{m_a}{m_a + m_f} v_0$
 $t = \sqrt{\frac{2h}{g}}$

$$d = \frac{m_a}{m_a + m_f} v_0 \cos \theta \sqrt{\frac{2h}{g}}$$

Final State

Check units:
 $m = \frac{kg}{kg} g \sqrt{\frac{m}{m/s^2}}$
 $m = \frac{kg}{kg} s$
 $m = m \Rightarrow ok$
 Is the answer complete?
 yes, the distance was found in terms of the requested values
 Is the answer reasonable?
 yes, the units check out ok and d will be smaller than h due to conservation of momentum
 Is the answer correctly stated?
 yes, it is in units of distance, meters

Gain on Force Concept Inventory

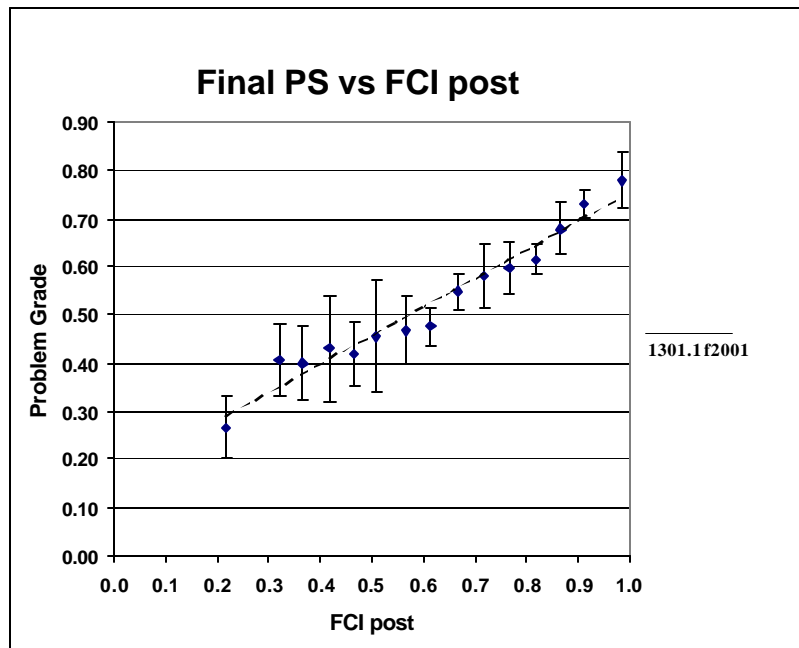

FCI Question

An elevator is being lifted up an elevator shaft at a constant speed by a steel cable, as shown in the figure. All frictional effects are negligible. In this situation, forces on the elevator are such that:

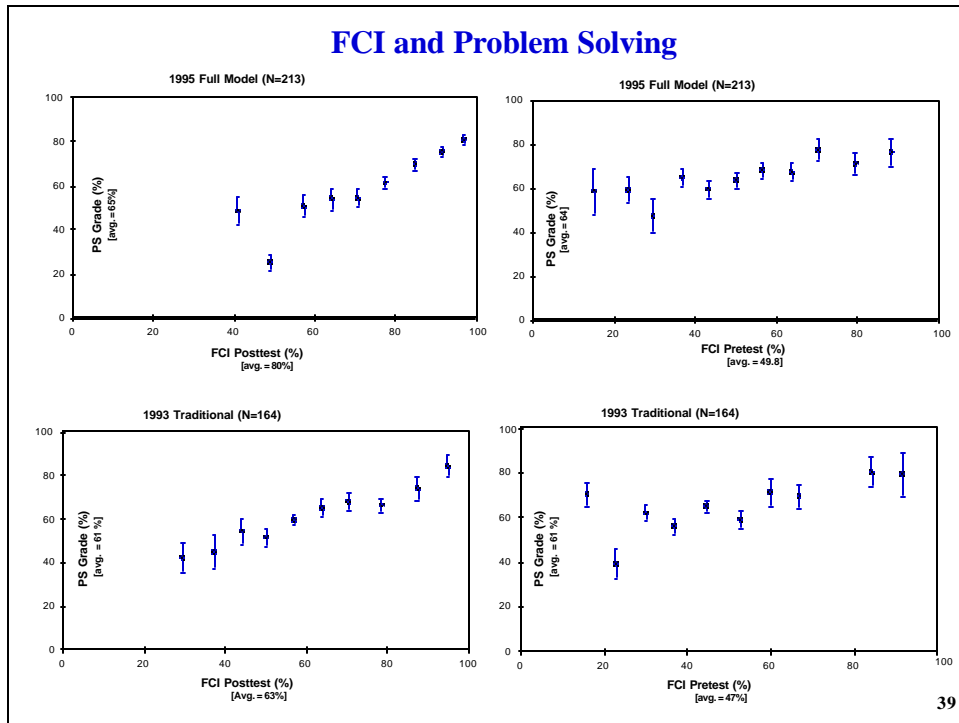

- (A) the upward force by the cable is greater than the downward force of gravity.
- (B) the upward force by the cable is equal to the downward force of gravity.
- (C) the upward force by the cable is smaller than the downward force of gravity.
- (D) the upward force by the cable is greater than the sum of the downward force of gravity and a downward force due to the air.
- (E) None of the above. (The elevator goes up because the cable is shortened, not because an upward force is exerted on the elevator by the cable).

37

38

FCI and Problem Solving
